

ABSTRACT OF THE DISCLOSURE

The present invention provides an image capturing apparatus capable of realizing both improved operability and higher picture quality. In the case where a sports mode which is mainly selected when the subject is a moving subject is set, at the
5 time of image capturing, by electrically connecting a first terminal and a second terminal of a switch to each other to set a state where a base current of a transistor does not flow, a substrate voltage is not switched. On the other hand, in the case where the normal image capturing mode is set which is mainly selected when the subject is stationary, the first terminal and a third terminal of the switch are electrically connected to each other,
10 and a signal is supplied to the base side of the transistor through a resistor, thereby setting so that an emitter current of the transistor flows and switching the substrate voltage.
